Brambleloop tester record -- Crochet Hexagonal Bread Basket

market-basket-small@1.3.0 content c4aa14a000e5439b scope: full_make size: small

This sheet covers exactly one size (small). Another size needs its own sample and its own sheet.

your tester reference _____

baskets made (of 1) _____

grams used, colour A (cream) _____

grams used, colour B (wine) _____

ball band: grams per ball _____

ball band: metres per ball _____

hook used (mm) _____

swatch: stitches per 10 cm _____

swatch: rounds per 10 cm _____

base across the points (cm) _____

base across the flats (cm) _____

wall height outside, table to rim at mid-flat (cm) _____

optional: inside depth (cm) _____

base sits flat, no rocking? yes/no _____

holds its shape? yes/no _____

base edge: crisp fold or rounded curve _____

if rounded: wall upright from round _____

six corners visible at the rim? yes/no _____

rim across the points (cm) _____

optional: height just after round 11 (cm) _____

total hours _____

followed exactly? yes/no _____

anything unclear or wrong (round numbers) _____

Protocol

1. Before starting: weigh each full ball and record the ball band (grams and metres)
2. Work a 10 x 10 cm sc swatch first; record stitches and rounds per 10 cm and the hook; then RE-WEIGH each ball and use that as its start weight, so the swatch's yarn is not counted as project yarn
3. Make the basket exactly as written in the test PDF; note every place you had to guess, re-read or rip back, with the round number. Optional: just after round 11, note how tall the work stands (cm)

4. Weigh what is left of each ball; grams used = re-weighed start minus end, per colour

5. Measure the finished base across the points and across the flats, in cm, without stretching. Measure the wall height OUTSIDE: from the flat table to the top of the rim, at the middle of a flat side (optional: the inside depth too)

6. Set the empty basket on a flat table. Does the base sit flat without rocking? Does it hold its shape (walls upright, no collapse, lean or flare)? Answer yes or no to each, and write any problem in the problems box

7. Look at where the base turns into the wall: a crisp fold, or a rounded curve? If rounded, from which round is the wall upright? Are the six corners still visible at the rim (yes or no)? Measure the rim across the points (cm)

8. Record total hours (not the swatch) and whether you followed the instructions exactly

9. Photograph in daylight on a real surface (wood, linen or a countertop). Keep every camera file UNEDITED: no filter, crop, resize or retouch; landscape or square, at least 2000 px each side, the whole basket in frame with space around it

10. Shots: (1) three-quarter view from about 30 degrees above, empty or with two or three rolls below the rim -- the listing's first photo; (2) straight down from above; (3) side view at table level; (4) a tape measure across the points, then a tape at wall height; (5) close-up of the rim and colour change; (6) in use on a set table with bread

11. Return the record sheet and the original photo files; the operator enters them (POST /api/physical-test and /api/physical-photo)

No review, rating or favourite is requested. Your fee does not depend on your opinion.
