

BRAMBLELOOP STUDIO ACCEPTANCE TESTS & AUTONOMY GATES

Gate A - Infrastructure

Worker restart does not lose durable jobs. Duplicate job execution cannot duplicate publication/messages/spend. Database backup and tested restore succeed. Dead-letter queue and retry/backoff work. Audit logs identify actor, action and artifact.

Gate B - Pattern Safety

A known-good pattern fixture compiles. A deliberately broken stitch-count fixture fails. A bad repeat fails. A customer-facing instruction mutation that changes construction is caught by reverse compilation. A corrected bug creates a regression test.

Gate C - Asset Truth

A listing image containing a motif/component absent from CIR is rejected. Unsupported size/material/difficulty claims are blocked. Asset provenance is stored.

Gate D - Commercial Safety

Price/promotion changes pass policy rules. Ad budget breach is prevented or automatically paused. Contribution accounting reconciles to test transactions. Agent API/token ceilings work.

Gate E - Customer Experience

Routine support is answered from the correct pattern version. Repeated defect reports correlate into one incident. Support cannot silently patch CIR. P0/P1 incident can halt publication workflow.

Gate F - Shadow Mode Graduation

At least one full simulated product completes Market Radar -> Opportunity -> CIR -> QA -> PDF/assets -> pricing -> listing draft -> launch plan -> simulated support without routine human intervention.

Only capabilities that pass their tests may graduate from SHADOW to STAGING to LIMITED PRODUCTION to PRODUCTION.
